SKY classic

SKY classic 3.5

narrow platform

THE SLIMMER CLASSIC IMPLANT IS RELIABLE.

bredent group

Narrow gaps.
Big possibilities.

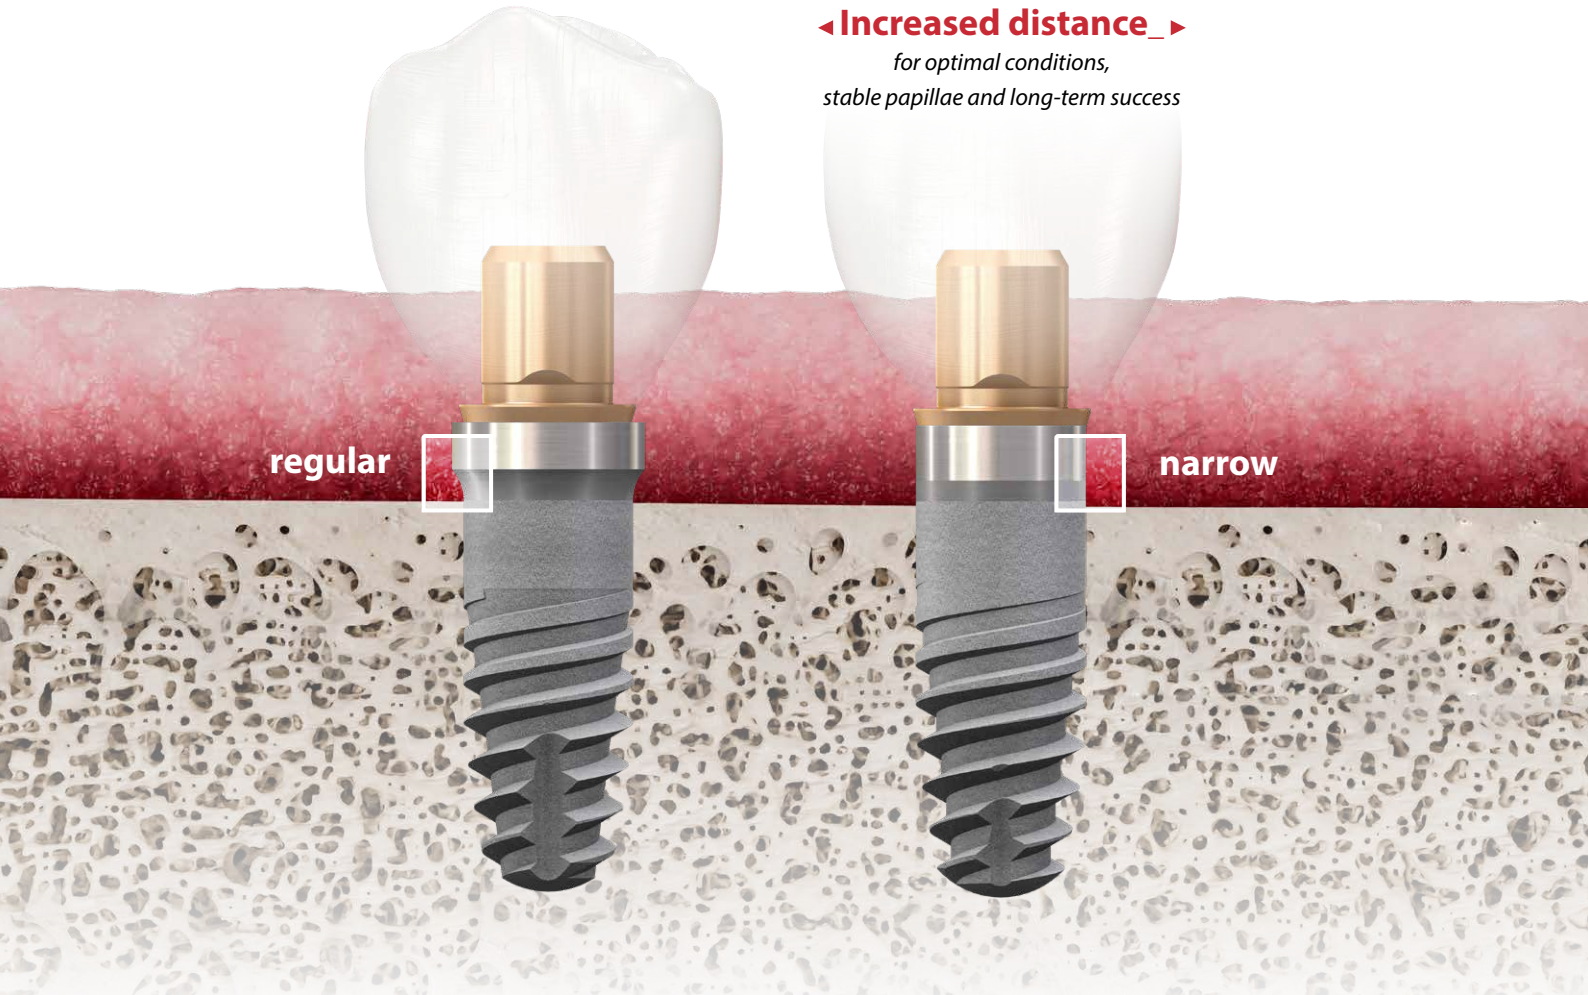

The ideal implant for cases where space is limited.

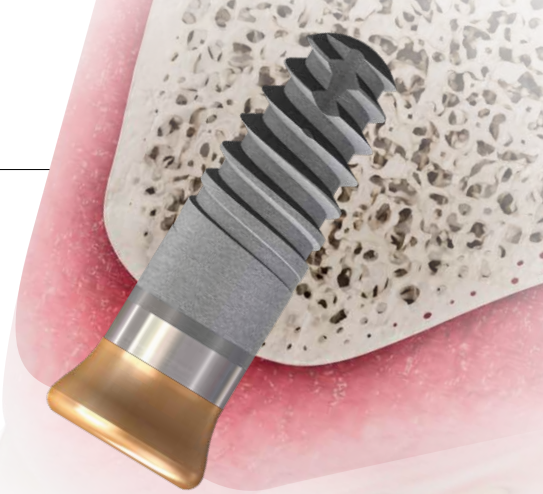

The SKY classic 3.5 narrow platform creates the necessary space for biologically stable and aesthetic results - even in challenging cases.

LESS TITANIUM -
MORE SOFT TISSUE.

- More distance to the neighbouring tooth
- More distance between two implants
- High stability
- Implants and abutments have the same diameter

◂ Increased distance_ ▸
for optimal conditions, stable papillae and long-term success

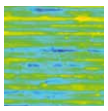

Tissue level reimagined.

STABILITY STARTS
IN THE SOFT TISSUE.

The tissue-level design shifts the implant-abutment junction from the bone area to the soft tissue, thereby reducing critical micro movements in the crestal area.

- Optimal soft tissue integration
- Preservation of crestal bone structure
- Reduced risk of peri-implantitis
- Long-term stable results

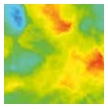

osseo-connect-surface (ocs)®

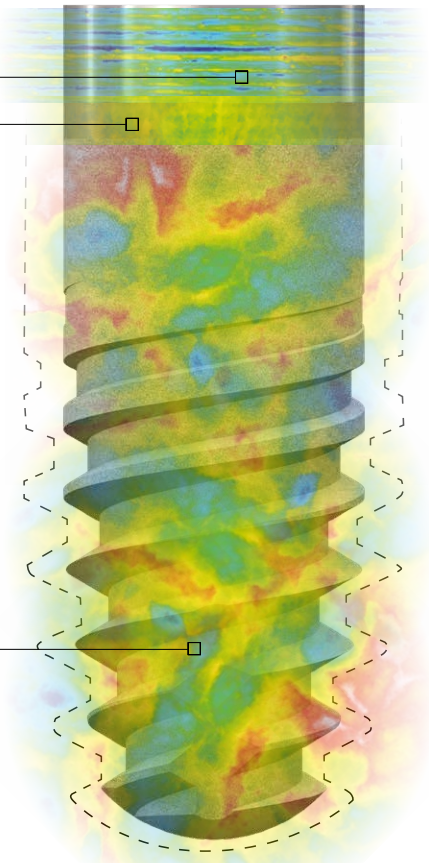

1.5 mm machined surface
→ supports connective tissue adhesion

0.5 mm etched surface
→ allows bone and soft tissue adaptation

Blasted & etched surface
→ for attachment of osteoblasts for rapid osseointegration

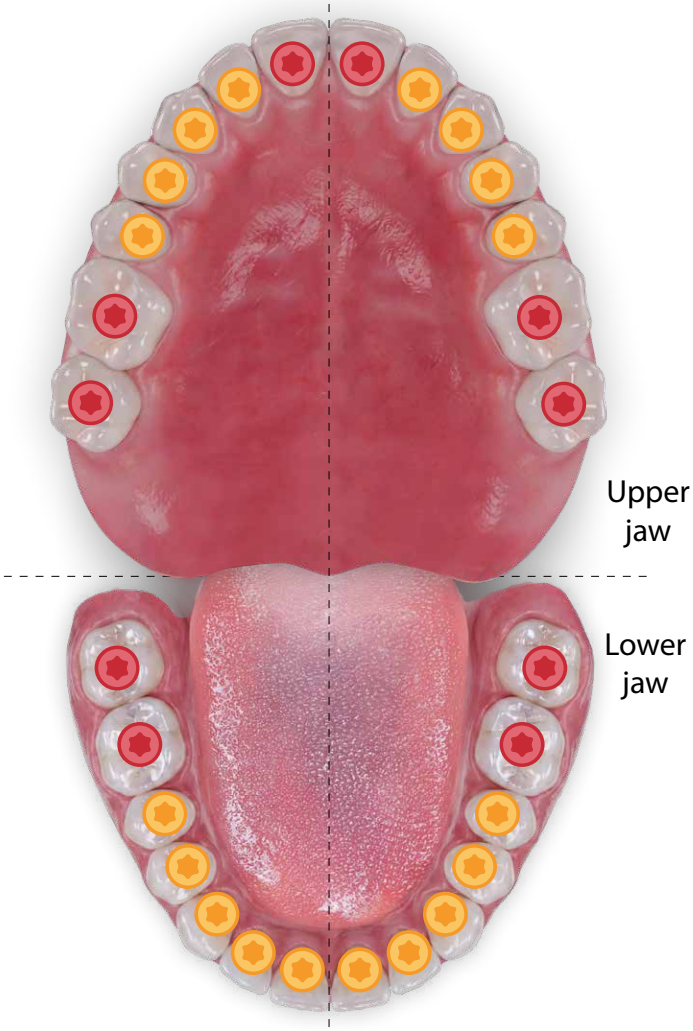

SKY classic

The ideal implant in ***more than 60% of positions.***

*The **SKY classic narrow** platform is ideal for the implant positions with orange symbols.*

***SKY classic narrow** platform*

***SKY classic regular** platform*

FOR OPTIMAL AESTHETICS

WITH PAPILLA AND BONE STABILITY.

SKY classic narrow platform creates the biologically necessary space - for aesthetic results with papillae and long-term bone stability.

- Sufficient distance to neighbouring tooth **(min. 1.5 mm)**
- Sufficient space between implants
- Sufficient space **for stable papillae and bones**

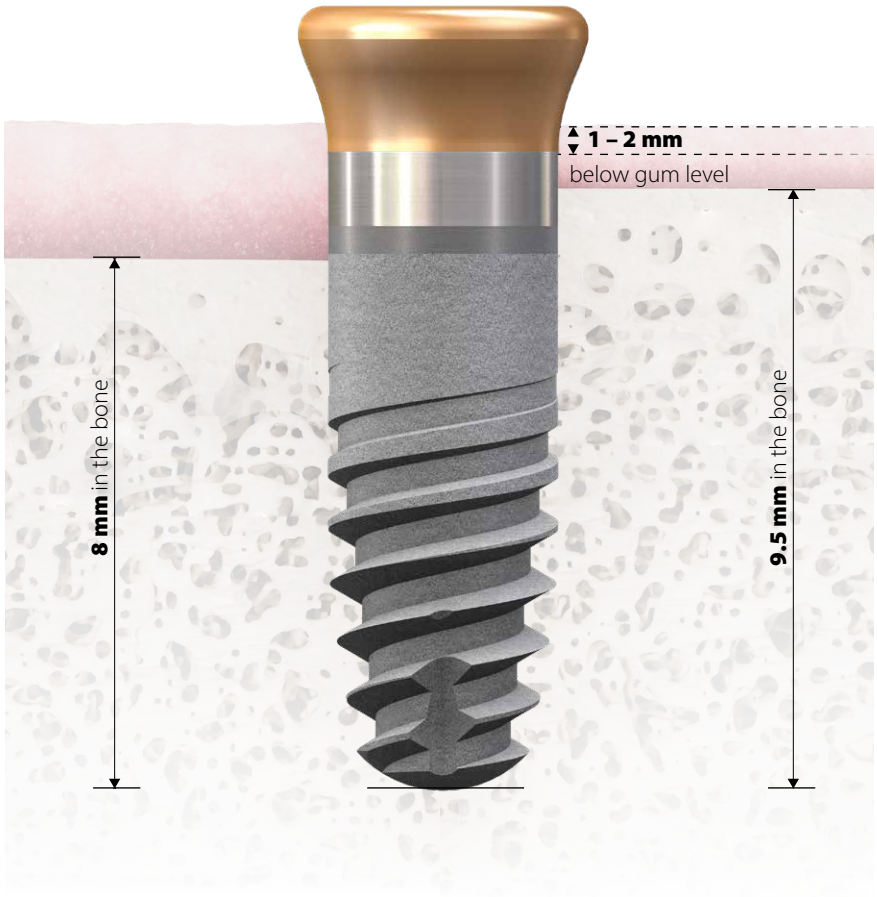

High flexibility in implant positioning.

*FOR **COMPLEX** ANATOMICAL **CASES**.*

SKY classic | narrow platform

The SKY classic 3.5 narrow platform is positioned 1-2 mm subgingivally and offers optimal conditions for stable soft tissue integration. This is because the supracrestal implant-abutment junction prevents micro movements in the crestal bone, yielding long-term stable conditions in the hard and soft tissue.

Thanks to its high flexibility, the system is especially well suited for anatomically demanding cases such as sloping alveolar ridges or thin gingiva. The soft tissue-friendly surface also helps reduce the risk of periimplantitis.

Variability

→ 1 - 2 mm below the gum level and between 8.0 - 9.5 mm in the bone for a SKY classic 3.5 narrow platform of 10 mm length.

Less leverage forces.
Greater safety.

HIGH MECHANICAL STABILITY

THANKS TO LOWER CROWN HEIGHT.

Supra-crestal implants reduce crown height by 2-3 mm compared to subcrestal implants. Shorter crowns reduce the load by approx. 10% per millimetre.

- Increased screw stability and improved anchorage
- Reliable long-term load capacity of the assembly
- Higher mechanical stability and longer service life

SKY classic

3 mm longer crowns increase the vertical load by approx. 30%.

SKY classic *referral workflow*

1

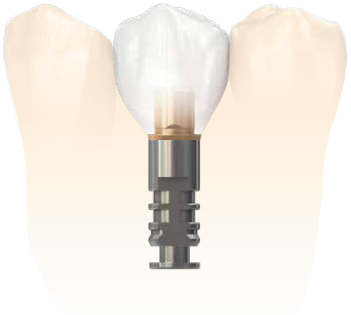

The surgeon places the implant in the planned position and scans the position of the implant during surgery.

Open healing with gingiva former prevents the need for additional surgery and improves aesthetics.

2

The crown abutment or restoration can be fabricated at a leisurely pace during the healing phase.

3

The patient is treated immediately upon arrival - faster treatment leads to happier patients.

SURGEON

REFERRAL

PATIENT

BENEFITS FOR

the surgeon

- Increased efficiency
- Fewer procedures
- More patients

the referral

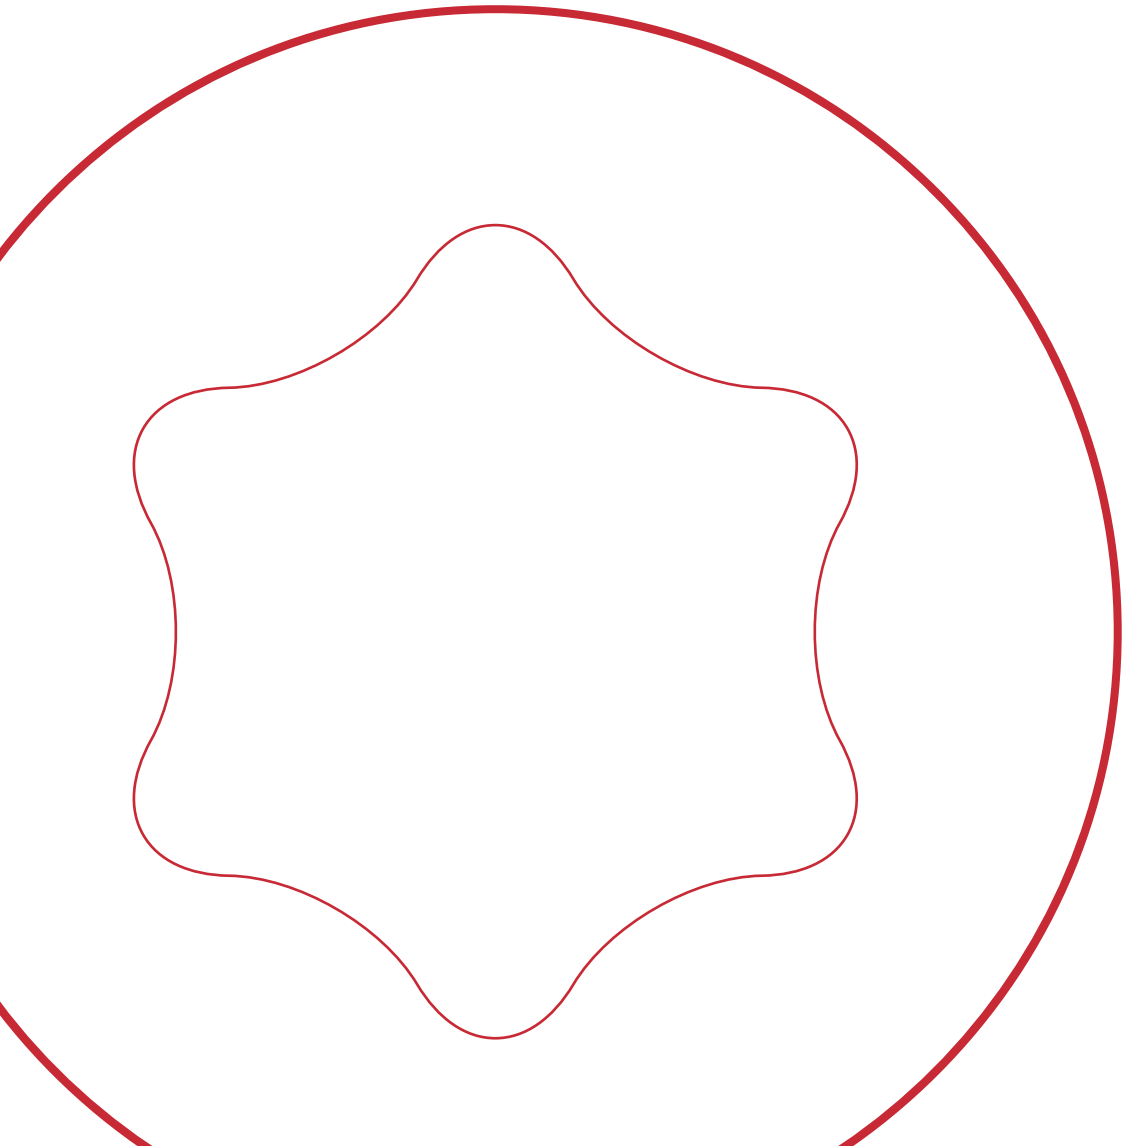

- Fast treatment
- Predictable processes
- Aesthetic results

the patient

- Fewer appointments
- Less stress thanks to fewer interventions
